

# Download Ecosystem Management In The Boreal Forest

Boreal Ecosystem-Atmosphere Study (BOREAS) The Boreal Ecosystem-Atmosphere Study (BOREAS) was a major international research field study in the Canadian boreal forest. In contemporary times, the boreal forest has suffered little deforestation, defined as the permanent conversion of forest area to non-forest due to activities associated with agriculture, urban or recreational development, oil and gas development, and flooding for hydroelectric projects. The circumpolar range of the boreal forest. About two-thirds of the area is in Eurasia. The sector in Eastern Canada lies farthest from the North Pole. Canada's boreal region covers almost 60 percent of the country's land area, essentially spanning from the Atlantic to the Pacific. At 2,000,000 mi<sup>2</sup>, (over 5,740,000 km<sup>2</sup>), it is one of the largest and most complex ecosystems on the planet., Ecosystem Management In The Boreal Forest.
