

Download How To Bi Amp Speakers With One Amp

Bi-wiring a speaker can be a relatively inexpensive way to improve overall sound quality. Ideally, one would run two identical lengths (and type and gauge) of two-conductor wire to each speaker. If you do not want to bi-amp or bi-wire your speakers, you can simply connect your amplifier to one set of binding posts, then use jumpers (as shown below) to connect the low frequencies to the mid and high frequencies. Speakers are usually a combination of two specific speakers: high frequency speakers (or tweeters) and low frequency (or bass) speakers. Both Bi-Wiring and Bi-Amping try to improve sound quality by isolating these components from one another. So any reduction in % IMD will depend on the qualities of the amp/amps, not on whether you use one amp or two/bi-amp. That is you still have the IMD for the full spectrum. That is you still have the IMD for the full spectrum., How To Bi Amp Speakers With One Amp.
